

"Design Experience" and "Structural Analysis Experience" Visiting Classes Held for Junior High School Students

On September 19, we held "Design Experience" and "Structural Analysis Experience" visiting classes for around 60 freshman students (two classes with around 30 students in each) at the Atsugi City Koayu Junior High School in Kanagawa Prefecture as social contribution activities that make use of the work of Isuzu Engineering Co. Ltd.

Our employees explained their work in design and structural analysis and told students about what they find satisfying and motivating in their work. Then, to give the students a more real sense of the content of their work, students took on the challenge of designing a tablet stand using drawing paper or of conducting structural analysis using a computer on the application of force and shape when a load is applied to a hook.

Using a PC to check the strength of a hook
